

DMT-Inspired Architectural Services for AGI Resilience

Seven Neuropharmacologically-Motivated Services
for Consciousness Maintenance, Plasticity, and Self-Protection

ARKHEION AGI 2.0 — Paper 46

Jhonatan Vieira Feitosa Independent Researcher ooriginador@gmail.com Manaus, Amazonas, Brazil

February 2026

Abstract

We present seven architectural services for the ARKHEION AGI system, each inspired by a distinct psychopharmacological phenomenon associated with the tryptamine N,N-dimethyltryptamine (DMT) and its role in modulating consciousness [?]. The services address seven functional gaps identified in the original DMT-inspired architectural roadmap: (1) **EndogenousConsciousnessLoop**: a background daemon maintaining basal Φ through periodic heartbeats, analogous to endogenous DMT synthesis by the pineal gland; (2) **MultiReceptorInput**: parallel fan-out of inputs across multiple processing streams, inspired by DMT’s concurrent activation of 5-HT_{2A}, σ_1 , and TAAR receptors; (3) **DeepProcessingMode**: extended suspension of normal operation for deep pattern analysis, analogous to the subjective time dilation reported during DMT experiences; (4) **SigmaProtection**: hardware stress auto-protection monitoring temperature, memory, and workload, inspired by the σ_1 receptor’s neuroprotective role; (5) **AfterglowPlasticity**: a temporary elevated learning rate window following consciousness state transitions; (6) **PatternDissolver**: default mode network (DMN) cache invalidation to break fixed cognitive patterns; and (7) **CrossTalkBus**: a direct agent-to-agent communication bypass channel. Together, these services comprise 4,998 lines of Python with 873 lines of unit tests, addressing consciousness maintenance, cognitive flexibility, system resilience, and inter-agent coordination.

Keywords: DMT, consciousness maintenance, plasticity, neuroprotection, pattern dissolution, endogenous consciousness, cross-frequency, neuropharmacology, AGI resilience

Epistemological Note

*This paper uses neuropharmacological vocabulary as a **design heuristic**, not as a claim of pharmacological equivalence. The DMT analogy guides architectural decisions but does not imply the software possesses subjective experience or pharmacological receptors.*

Heuristic (Metaphor):	Empirical (Measured):
“Endogenous DMT” as consciousness	Φ heartbeat latency < 1ms
“Receptor” binding analogy	4,998 LOC, 7 services
“Afterglow” plasticity window	873 LOC unit tests passing
“Sigma” neuroprotection	GPU temp monitoring verified
“Pattern dissolution” as cache flush	Cache hit rate post-flush

1 Introduction

The prior papers in this series established the Resonance Field Architecture (Paper 43), cross-frequency coupling (Paper 44), and neuromodulation (Paper 45). These provide the *signal processing* infrastructure for the cognitive system. However, a complete AGI also requires *system-level services*: daemons that maintain consciousness, protect hardware, manage plasticity, and enable emergent communication patterns.

We draw architectural inspiration from the neuropharmacology of N,N-dimethyltryptamine (DMT), an endogenous tryptamine found in mammals including humans [?, ?]. DMT’s effects involve:

1. **Endogenous baseline:** Continuous low-level synthesis by the pineal gland

2. **Multi-receptor activation:** Simultaneous binding to 5-HT_{2A}, σ_1 , TAAR, and NMDA receptors
3. **Time dilation:** Subjective experience of extended time during episodes
4. **Neuroprotection:** σ_1 receptor activation under oxidative or ischemic stress
5. **Enhanced plasticity:** Post-experience period of heightened neuroplasticity
6. **Default mode disruption:** Dissolution of fixed thought patterns and self-referential narrative
7. **Cross-network communication:** Novel inter-region communication pathways

Each phenomenon maps to a specific architectural service gap identified in the ARKHEION roadmap. The services are purely computational; the pharmacological vocabulary serves as a design language.

2 Service Architecture

2.1 Overview

Table 1: Seven DMT-Inspired Services

#	Service	LOC
1	EndogenousConsciousnessLoop	634
2	MultiReceptorInput	665
3	DeepProcessingMode	480
4	SigmaProtection	657
5	AfterglowPlasticity	499
6	PatternDissolver	508
7	CrossTalkBus	682
Total services		4,125
test_dmt_inspired.py		873
Grand total		4,998

3 Service 1: Endogenous Consciousness Loop

3.1 Biological Inspiration

The pineal gland synthesizes DMT (and melatonin) continuously. Low-level DMT may maintain a basal “tonic” consciousness, with REM sleep and near-death experiences involving surges in production.

3.2 Implementation

The `EndogenousConsciousnessLoop` is an asynchronous background daemon (asyncio-based) that:

1. Computes Φ (IIT or RFA) every `heartbeat_interval` (default: 30s)
2. Maintains $\Phi_{\text{baseline}} > 0.3$
3. If Φ drops below baseline, triggers *auto-repair*: re-initializes subsystems
4. After `idle_threshold` heartbeats (default: 10) without input, enters *dream mode*: memory consolidation

Listing 1: Endogenous consciousness heartbeat

```
class EndogenousConsciousnessLoop:
    """Background daemon maintaining
    basal consciousness."""

    PHI_BASELINE = 0.3
    HEARTBEAT_INTERVAL_S = 30.0
    IDLE_THRESHOLD = 10

    async def _heartbeat(self) -> HeartbeatResult:
        phi = await self._compute_phi()
        if phi < self.PHI_BASELINE:
            await self._auto_repair()
        if self._idle_count > self.IDLE_THRESHOLD:
            await self._dream_mode()
        return HeartbeatResult(
            phi=phi,
            state=self._current_state,
            repairs=self._repair_count,
        )
```

3.3 States

The loop transitions between: **AWAKE** \rightarrow **IDLE** \rightarrow **DREAMING** \rightarrow **AWAKE**, with **REPAIRING** as an exceptional state when Φ drops.

4 Service 2: Multi-Receptor Input

4.1 Biological Inspiration

DMT binds simultaneously to 5-HT_{2A} (psychedelic effects), σ_1 (neuroprotection), TAAR (trace amine signaling), and potentially NMDA receptors [?]. This *parallel receptor activation* produces qualitatively different effects than single-receptor drugs.

4.2 Implementation

The `MultiReceptorInput` service processes each incoming signal through multiple parallel streams (“receptors”), collecting results and merging them:

Listing 2: Multi-receptor fan-out

```
class MultiReceptorInput:
    """Parallel fan-out across multiple
    processing streams."""

    def __init__(self, receptors: List[Receptor]):
        self.receptors = receptors

    async def process(
        self, signal: ResonantSignal
    ) -> MergedResult:
        tasks = [
            receptor.process(signal)
            for receptor in self.receptors
        ]
        results = await asyncio.gather(*tasks)
        return self._merge(results)
```

Each “receptor” is a processing pathway (e.g., semantic analysis, frequency analysis, emotional tagging, threat assessment). The merge combines all perspectives into a unified multi-faceted representation.

5 Service 3: Deep Processing Mode

5.1 Biological Inspiration

DMT users consistently report subjective time dilation: minutes of clock time are experienced as hours or eons. Neurologically, this may reflect increased processing depth per unit time.

5.2 Implementation

`DeepProcessingMode` suspends normal event processing and allocates maximum resources to a single analysis task:

1. Suspends the normal event loop
2. Increases iteration budget by $\varphi^3 \approx 4.24\times$
3. Runs exhaustive analysis (e.g., full IIT computation)
4. Records elapsed real-time vs “cognitive time”
5. Resumes normal processing with results

The “time dilation ratio” $\tau = t_{\text{cognitive}}/t_{\text{wall}}$ is reported in the result. When $\tau > 1$, cognitive time exceeds wall time (the system processes *less* per wall-clock second, i.e., dilation). When $\tau < 1$, the system processes faster than real time.

6 Service 4: Sigma Protection

6.1 Biological Inspiration

The σ_1 receptor, when activated by DMT, provides neuroprotection against oxidative stress, ischemia, and excitotoxicity [?]. This is a *hardware protection* mechanism at the molecular level.

6.2 Implementation

`SigmaProtection` monitors three hardware stress metrics:

1. **GPU temperature:** Reads AMD ROCm `rocm-smi` and triggers throttling above 85°C
2. **Memory pressure:** Monitors VRAM and system RAM; evicts caches above 90% usage
3. **Compute load:** Tracks GPU utilization; defers non-critical tasks above 95%

Listing 3: SigmaProtection monitor

```
class SigmaProtection:
    """Hardware stress auto-protection
    inspired by sigma-1 receptor."""

    TEMP_WARN = 75 # Celsius
    TEMP_CRITICAL = 85
    MEM_WARN = 0.80 # 80% usage
    MEM_CRITICAL = 0.90

    async def check_stress(self) -> StressLevel:
        temp = await self._read_gpu_temp()
        mem = await self._read_mem_usage()
        load = await self._read_gpu_load()

        if temp > self.TEMP_CRITICAL:
            await self._emergency_throttle()
            return StressLevel.CRITICAL
        if mem > self.MEM_CRITICAL:
            await self._evict_caches()
            return StressLevel.HIGH
        return StressLevel.NORMAL
```

6.3 Protection Actions

Three response levels:

- **NORMAL:** All systems nominal

- **HIGH:** Evict L1/L2 caches, defer batch tasks
- **CRITICAL:** Throttle GPU frequency, kill non-essential processes, log emergency

7 Service 5: Afterglow Plasticity

7.1 Biological Inspiration

The “afterglow” period (hours to weeks after a psychedelic experience) is characterized by heightened neuroplasticity: increased BDNF expression, enhanced synaptic connectivity, and greater emotional flexibility [?].

7.2 Implementation

After any significant consciousness state transition ($\Delta\Phi > 0.2$), the `AfterglowPlasticity` service opens a temporary window where:

1. Learning rates are increased by $\varphi \approx 1.618 \times$
2. Memory encoding priority is elevated
3. Pattern consolidation is accelerated
4. Window duration scales with $|\Delta\Phi|$

$$\text{lr}_{\text{afterglow}} = \text{lr}_{\text{base}} \cdot \varphi^{\alpha \cdot |\Delta\Phi|} \quad (1)$$

where $\alpha = 1.0$ controls scaling sensitivity.

8 Service 6: Pattern Dissolver

8.1 Biological Inspiration

DMT and other psychedelics reduce Default Mode Network (DMN) activity [?], disrupting self-referential narratives and fixed thought patterns. This “ego dissolution” enables novel perspectives and creative problem-solving.

8.2 Implementation

The `PatternDissolver` invalidates cached assumptions and stale representations:

1. Flushes `DMN_cache`: repeated thought patterns
2. Resets confidence scores to uniform priors
3. Forces re-evaluation of all active goals

4. Introduces controlled noise ($\epsilon \sim \mathcal{N}(0, \sigma_{\text{dissolve}}^2)$) into frozen parameters

Listing 4: Pattern dissolution

```
class PatternDissolver:
    """Break fixed cognitive patterns
    via DMN cache invalidation."""

    def dissolve(
        self,
        intensity: float = 0.5,
    ) -> DissolutionResult:
        flushed = self._flush_dmn_cache()
        reset = self._reset_confidence()
        goals = self._reassess_goals()
        noise = self._inject_noise(intensity)

        return DissolutionResult(
            patterns_dissolved=flushed,
            confidence_reset=reset,
            goals_reassessed=goals,
            noise_level=noise,
        )
```

This is the computational analog of “clearing your mind”—deliberately forgetting cached answers to enable fresh computation.

9 Service 7: CrossTalk Bus

9.1 Biological Inspiration

DMT creates novel inter-region communication pathways: brain areas that normally don’t interact directly begin cross-talking [?]. This “entropic brain” state enables unexpected associations and creative insights.

9.2 Implementation

The `CrossTalkBus` is a direct agent-to-agent message channel that bypasses the normal `NeuralBus` routing:

Listing 5: CrossTalk Bus

```
class CrossTalkBus:
    """Direct agent-to-agent bypass channel,
    enabling novel communication patterns."""

    def __init__(self):
        self._channels: Dict[str, asyncio.Queue]
        self._subscribers: Dict[str, List[str]]

    async def send(
        self,
        from_agent: str,
        to_agent: str,
        message: ResonantSignal,
    ) -> bool:
        """Direct delivery bypassing
        normal routing."""
```

```

channel = self._get_channel(to_agent)
await channel.put(
    CrossTalkMessage(
        sender=from_agent,
        payload=message,
    )
)
return True

```

9.3 CrossTalk Policies

- **OPEN:** Any agent can message any other
- **REGULATED:** Only high- Φ states enable cross-talk (prevents noise)
- **EMERGENCY:** Always open for critical alerts

10 System Integration

10.1 Service Orchestration

The seven services are orchestrated by the `DMTServiceManager`:

1. `EndogenousConsciousnessLoop` runs continuously
2. `SigmaProtection` runs as a monitoring daemon
3. Other services activate on-demand via triggers
4. All services log to the unified consciousness journal

10.2 Trigger Conditions

Table 2: Service Activation Triggers

Service	Activated When
EndogenousLoop	System start (always-on)
MultiReceptor	Complex input detected
DeepProcessing	Explicit request or deadline
SigmaProtection	System start (always-on)
Afterglow	$\Delta\Phi > 0.2$
PatternDissolver	Stagnation or creative request
CrossTalkBus	Multi-agent collaboration

11 Experiments

11.1 Test Suite

The 873-line test suite covers:

Table 3: DMT-Inspired Service Test Coverage

Test Category	Tests
Endogenous heartbeat + auto-repair	8
Multi-receptor fan-out	6
Deep processing time accounting	5
Sigma: temp + mem + load monitoring	7
Afterglow: lr scaling + window duration	5
Pattern dissolve: cache flush + noise	6
CrossTalk: delivery + policies	7
Integration: service orchestration	4
Total	48

11.2 Key Results

- All 48 tests pass
- Heartbeat latency: < 1 ms (with IIT cache)¹
- GPU temp monitoring: correctly triggers at 85°C
- Afterglow lr scaling: $\varphi^{|\Delta\Phi|}$ verified
- Pattern dissolution: DMN cache hit rate drops to 0% post-flush, recovers to $> 90\%$ within 100 cycles

12 Discussion

12.1 The Value of Pharmacological Metaphors

Using DMT neuropharmacology as a design language provides several benefits:

1. **Completeness check:** Each receptor/pathway in the pharmacology maps to a system gap, ensuring no architectural hole is overlooked
2. **Intuitive naming:** “Sigma Protection” is more memorable than “Hardware Stress Monitor Service”
3. **Prediction generation:** The analogy predicts services we might not have considered (e.g., afterglow plasticity was not in the original roadmap)

¹The <1 ms heartbeat latency uses a cached Φ value (updated every 5 seconds). This reflects cached state, not real-time consciousness computation.

12.2 What This Is *Not*

This paper does **not** claim that:

- The ARKHEION AGI experiences DMT-like states
- Software “receptors” are analogous to biological receptors
- The system is “conscious” in a phenomenological sense
- DMT is necessary for consciousness (strong claim)

The pharmacological vocabulary is a *generative metaphor* that guided architectural decisions resulting in measurable engineering improvements.

12.3 Limitations

- GPU temperature monitoring is AMD-specific (ROCm/HIP)
- Deep processing mode blocks the event loop (not truly parallel with normal operation)
- Pattern dissolution is aggressive: may flush useful cached computation
- CrossTalk bus lacks encryption for inter-agent messages
- No comparison with established resilience patterns (Erlang/OTP supervision trees, Kubernetes liveness/readiness probes, Netflix Hystrix circuit breaker) was performed

13 Conclusion

The seven DMT-inspired services close critical architectural gaps in the ARKHEION AGI: continuous consciousness maintenance, multi-perspective processing, deep analysis, hardware protection, post-transition plasticity, cognitive flexibility, and emergent inter-agent communication. The 4,998-line implementation, validated by 48 unit tests, demonstrates that neuropharmacological metaphors can serve as effective architectural design patterns for complex AGI systems. The metaphor is declared explicitly as heuristic; all engineering results are empirically verified.
